

MASKING MATERIALS

Johnson Plastics Plus has a variety of quality Masking material from which to choose. Whether you are looking for deep sand blasting or a low tack mask great for color filling, you'll find what you're looking for here.

See the information listed below to choose the correct masking product for your project.

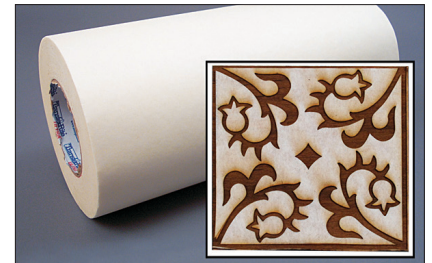

Green Laser Tape:

The Green laser Tape is used often for color filling applications, but is also excellent for sandblasting. Laser engrave through the Green Laser Tape, then sandblast or color fill. Available in 3 widths, this mask is a medium tack tape; laser-ready for wood, marble and even stone.

Paper Mask Medium Tack:

The Medium Tack Paper Masks are most often used as cutting masks - protecting the surface of the item being vector cut. Also used for color filling applications, the Medium Tack Paper Masks are easily removed and leave no residue after laser engraving. These masks are available in two widths for project versatility.

Polyester Flex & Rigid Masks:

The Polyester Flex and Rigid Masks are both used primarily for sandblasting applications. It is important to keep in mind that the Polyester Rigid Mask is slightly thicker than the Polyester Flex Mask. Both of these masks have a more aggressive adhesive than the Green Laser Tape.
