

LASER ENGRAVING LEATHER

Johnson Plastics Plus leather products easily engrave with all Co2 laser systems. Logos, text and clip art engrave crisp and clean. Professional results can be achieved by following these helpful tips:

- Use your laser to cut leather into shapes. Apply a Paper Mask (SUS015 or SUS016) before cutting to eliminate top surface contamination from sooty smoke.
- Apply leather pieces to wood plaques using Heavy Duty Mounting Tape (SUS116 or SUS117).
- Seal and condition leather using Leather Finish (LUS013) for a professional look.

Use moderate power settings and maximum engraving speed. Too much power will char the leather and reduce engraving quality.
